# A Tour of The Most Popular Machine Learning Algorithms

by **Jason Brownlee** on November 25, 2013 in [Understand Machine Learning Algorithms](#)

Tweet

Share

Share

In this post, we will take a tour of *the most popular machine learning algorithms*.

It is useful to tour the main algorithms in the field to get a feeling of what methods are available.

There are so many algorithms that it can feel overwhelming when algorithm names are thrown around and you are expected to just know what they are and where they fit.

I want to give you two ways to think about and categorize the algorithms you may come across in the field.

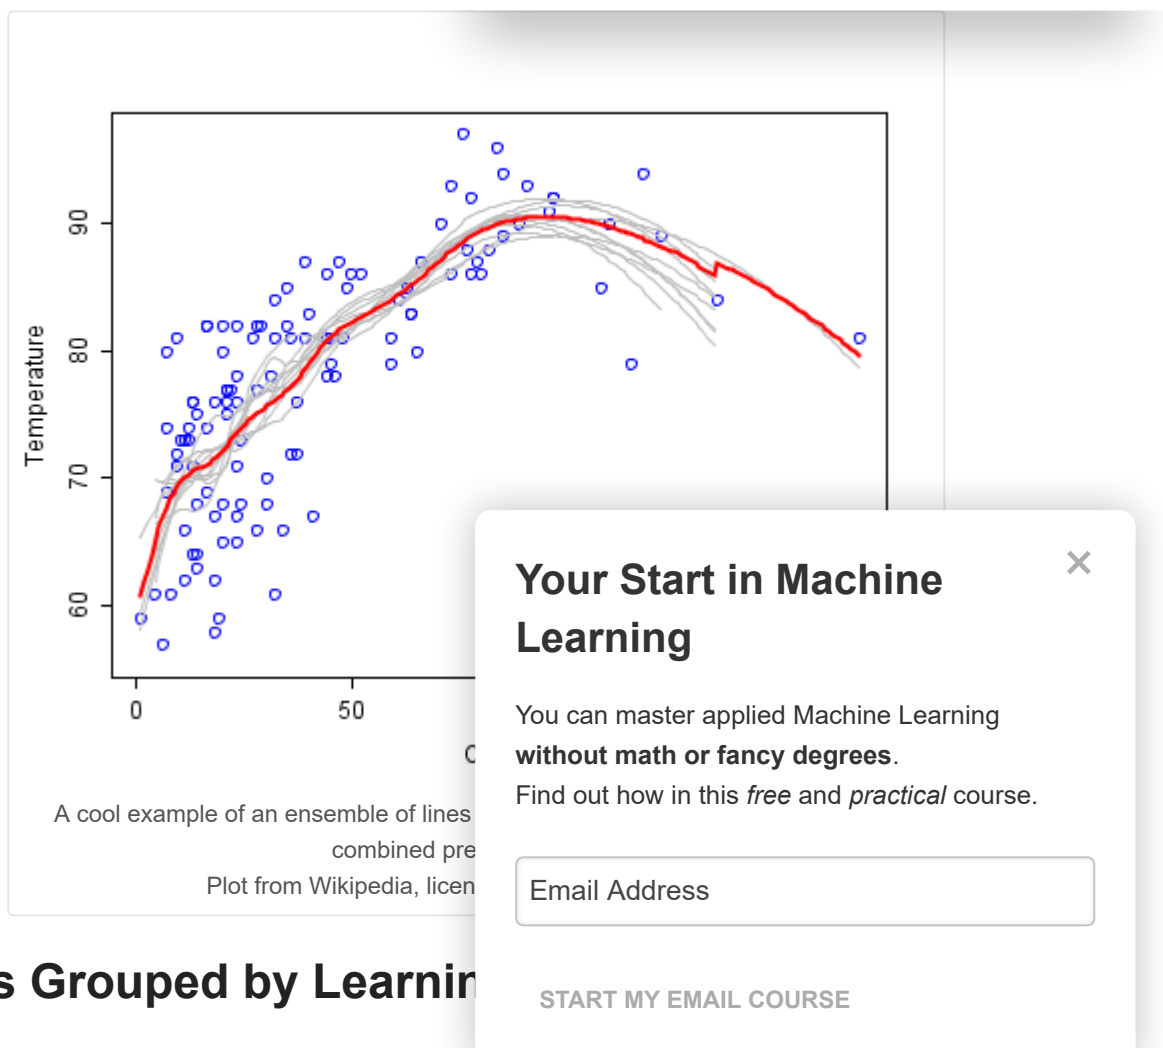

- The first is a grouping of algorithms by their **learning style**.
- The second is a grouping of algorithms by their **similarity** in form or function (like grouping similar animals together).

Both approaches are useful, but we will focus in on the grouping of algorithms by similarity and go on a tour of a variety of different algorithm types.

After reading this post, you will have a much better understanding of the most popular machine learning algorithms for supervised learning and how they are related.

Discover how machine learning algorithms work including kNN, decision trees, naive bayes, SVM, ensembles and much more [in my new book](#), with 22 tutorials and examples in excel.

Let's get started.

## Algorithms Grouped by Learning

There are different ways an algorithm can model a problem based on its interaction with the experience or environment or whatever we want to call the input data.

It is popular in machine learning and artificial intelligence textbooks to first consider the learning styles that an algorithm can adopt.

There are only a few main learning styles or learning models that an algorithm can have and we'll go through them here with a few examples of algorithms and problem types that they suit.

This taxonomy or way of organizing machine learning algorithms is useful because it forces you to think about the roles of the input data and the model preparation process and select one that is the most appropriate for your problem in order to get the best result.

## Let's take a look at three different learning styles in machine learning algorithms:

### 1. Supervised Learning

Input data is called training data and has a known label or result such as spam/not-spam or a stock price at a time.

Your Start in Machine Learning

A model is prepared through a training process in which it is required to make predictions and is corrected when those predictions are wrong. The training process continues until the model achieves a desired level of accuracy on the training data.

Example problems are classification and regression.

Example algorithms include: Logistic Regression and the Back Propagation Neural Network.

## 2. Unsupervised Learning

Input data is not labeled and does not have a known result.

A model is prepared by deducing structures present in the input data. This may be to extract general rules. It may be through a mathematical process to systematically reduce redundancy, or it may be to organize data by similarity.

Example problems are clustering, dimensionality reduction and association rule learning.

Example algorithms include: the Apriori algorithm and K-Means.

## 3. Semi-Supervised Learning

Input data is a mixture of labeled and unlabelled examples.

There is a desired prediction problem but the model must learn the structures to organize the data as well as make predictions.

Example problems are classification and regression.

Example algorithms are extensions to other flexible methods that make assumptions about how to model the unlabeled data.

## Overview of Machine Learning Algorithms

When crunching data to model business decisions, you are most typically using supervised and unsupervised learning methods.

Supervised Learning Algorithms

Unsupervised Algorithms

### Your Start in Machine Learning

You can master applied Machine Learning **without math or fancy degrees.** Find out how in this *free* and *practical* course.

START MY EMAIL COURSE

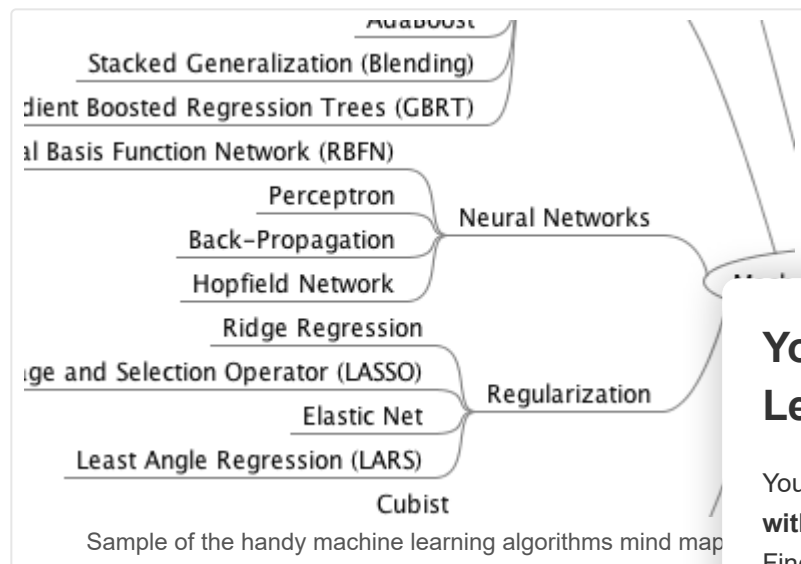

Semi-supervised Learning Algorithms

Your Start in Machine Learning

A hot topic at the moment is semi-supervised learning methods in areas such as image classification where there are large datasets with very few labeled examples.

## Get your FREE Algorithms Mind Map

I've created a handy mind map of 60+ algorithms organized by type.

Download it, print it and use it.

[START MY EMAIL COURSE](#)

## Algorithms Grouped By Similarity

Algorithms are often grouped by similarity in terms of instance-based methods, and neural network inspired methods.

I think this is the most useful way to group algorithms and it is the approach we will use here.

This is a useful grouping method, but it is not perfect. There are still algorithms that could just as easily fit into multiple categories like Learning Vector Quantization that is both a neural network inspired method and an instance-based method. There are also categories that have the same name that describe the problem and the class of algorithm such as Regression and Clustering.

We could handle these cases by listing algorithms twice or by selecting the group that subjectively is the “best” fit. I like this latter approach of not duplicating algorithms to keep things simple.

In this section, we list many of the popular machine learning algorithms grouped the way we think is the most intuitive. The list is not exhaustive in either the groups or the algorithms, but I think it is representative and will be useful to you to get an idea of the lay of the land.

**Please Note:** There is a strong bias towards algorithms used for classification and regression, the two most prevalent supervised machine learning problems you will encounter.

If you know of an algorithm or a group of algorithms not listed, put it in the comments and share it with us. Let's dive in.

## Regression Algorithms

[Your Start in Machine Learning](#)

Regression is concerned with modeling the relationship between variables that is iteratively refined using a measure of error in the predictions made by the model.

Regression methods are a workhorse of statistics and have been co-opted into statistical machine learning. This may be confusing because we can use regression to refer to the class of problem and the class of algorithm. Really, regression is a process.

The most popular regression algorithms are:

- Ordinary Least Squares Regression (OLSR)
- Linear Regression
- Logistic Regression
- Stepwise Regression
- Multivariate Adaptive Regression Splines (MARS)
- Locally Estimated Scatterplot Smoothing (LOESS)

Regression Algorithms

## Instance-based Algorithms

Instance-based learning model is a decision problem with a set of examples of training data that are deemed important to the model.

Such methods typically build up a database of examples. When new data is compared to the database using a similarity measure in order to find the best match and make a prediction. For this reason, instance-based methods are also called winner-take-all methods and memory-based learning. Focus is put on the representation of the stored instances and similarity measures used between instances.

The most popular instance-based algorithms are:

- k-Nearest Neighbor (kNN)
- Learning Vector Quantization (LVQ)
- Self-Organizing Map (SOM)
- Locally Weighted Learning (LWL)
- Support Vector Machines (SVM)

Instance-based Algorithms

### Your Start in Machine Learning

You can master applied Machine Learning **without math or fancy degrees**. Find out how in this *free* and *practical* course.

START MY EMAIL COURSE

## Regularization Algorithms

An extension made to another method (typically regression methods) that penalizes models based on their complexity, favoring simpler models that are also better at generalizing.

I have listed regularization algorithms separately here because they are popular, powerful and generally simple modifications made to other methods.

Your Start in Machine Learning

The most popular regularization algorithms are:

- Ridge Regression
- Least Absolute Shrinkage and Selection Operator (LASSO)
- Elastic Net
- Least-Angle Regression (LARS)

## Decision Tree Algorithms

Decision tree methods construct a model of decisions made based on actual values of attributes in the data.

Decisions fork in tree structures until a prediction decision is made for a given record. Decision trees are trained on data for classification and regression problems. Decision trees are often fast and accurate and a big favorite in machine learning.

The most popular decision tree algorithms are:

- Classification and Regression Tree (CART)
- Iterative Dichotomiser 3 (ID3)
- C4.5 and C5.0 (different versions of a powerful approach)
- Chi-squared Automatic Interaction Detection (CHAID)
- Decision Stump
- M5
- Conditional Decision Trees

## Bayesian Algorithms

Bayesian methods are those that explicitly apply Bayes' Theorem for problems such as classification and regression.

The most popular Bayesian algorithms are:

- Naive Bayes
- Gaussian Naive Bayes
- Multinomial Naive Bayes
- Averaged One-Dependence Estimators (AODE)
- Bayesian Belief Network (BBN)
- Bayesian Network (BN)

Regularization Algorithms

Decision Algorithms

### Your Start in Machine Learning

You can master applied Machine Learning **without math or fancy degrees**. Find out how in this *free* and *practical* course.

START MY EMAIL COURSE

## Clustering Algorithms

Clustering, like regression, describes the class of problem and the class of methods.

Clustering methods are typically organized by the modeling approaches such as centroid-based and hierarchical. All methods are concerned with using the inherent structures in the data to best organize the data into groups of maximum commonality.

The most popular clustering algorithms are:

- k-Means
- k-Medians
- Expectation Maximisation (EM)
- Hierarchical Clustering

### Your Start in Machine Learning

You can master applied Machine Learning **without math or fancy degrees**. Find out how in this *free* and *practical* course.

START MY EMAIL COURSE

## Association Rule Learning Algorithms

Association rule learning methods extract rules that be observed relationships between variables in data.

These rules can discover important and commercially useful associations in large multidimensional datasets that can be exploited by an organization.

The most popular association rule learning algorithms are:

- Apriori algorithm
- Eclat algorithm

Association Rule Learning Algorithms

## Artificial Neural Network Algorithms

Artificial Neural Networks are models that are inspired by the structure and/or function of biological neural networks.

They are a class of pattern matching that are commonly used for regression and classification problems but are really an enormous subfield comprised of hundreds of algorithms and variations for all manner of problem types.

Note that I have separated out Deep Learning from neural networks due to its recent popularity in the field. Here we are concerned with the

Your Start in Machine Learning

The most popular artificial neural network algorithms are:

- Perceptron
- Multilayer Perceptrons (MLP)
- Back-Propagation
- Stochastic Gradient Descent
- Hopfield Network
- Radial Basis Function Network (RBFN)

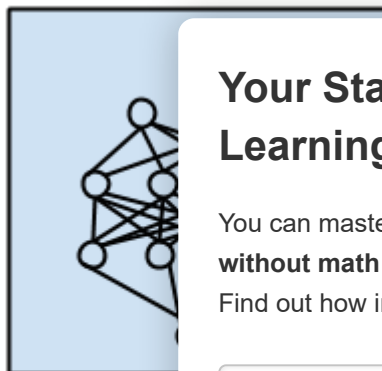

Artificial Neural Network Algorithms

## Deep Learning Algorithms

**Deep Learning** methods are a modern update to Artificial Neural Networks that exploit abundant cheap computation.

They are concerned with building much larger and more complex neural networks and, as commented on above, many methods are concerned with very large datasets of labelled analog data, such as image, text, audio, and video.

Deep Algo

The most popular deep learning algorithms are:

- Convolutional Neural Network (CNN)
- Recurrent Neural Networks (RNNs)
- Long Short-Term Memory Networks (LSTMs)
- Stacked Auto-Encoders
- Deep Boltzmann Machine (DBM)
- Deep Belief Networks (DBN)

## Dimensionality Reduction Algorithms

Like clustering methods, dimensionality reduction seek and exploit the inherent structure in the data, but in this case in an unsupervised manner or order to summarize or describe data using less information.

This can be useful to visualize dimensional data or to simplify data which can then be used in a supervised learning method. Many of these methods can be adapted for use in classification and regression.

- Principal Component Analysis (PCA)
- Principal Component Regression (PCR)
- Partial Least Squares Regression (PLSR)
- Sammon Mapping
- Multidimensional Scaling (MDS)

### Your Start in Machine Learning

You can master applied Machine Learning **without math or fancy degrees**. Find out how in this *free* and *practical* course.

START MY EMAIL COURSE

Your Start in Machine Learning

- Projection Pursuit
- Linear Discriminant Analysis (LDA)
- Mixture Discriminant Analysis (MDA)
- Quadratic Discriminant Analysis (QDA)
- Flexible Discriminant Analysis (FDA)

## Ensemble Algorithms

Ensemble methods are models composed of multiple weaker models that are independently trained and whose predictions are combined in some way to make the overall prediction.

Much effort is put into what types of weak learners to combine and the ways in which to combine them. This is a very powerful class of techniques and as such is very popular.

- Boosting
- Bootstrapped Aggregation (Bagging)
- AdaBoost
- Weighted Average (Blending)
- Stacked Generalization (Stacking)
- Gradient Boosting Machines (GBM)
- Gradient Boosted Regression Trees (GBRT)
- Random Forest

## Other Machine Learning Algorithms

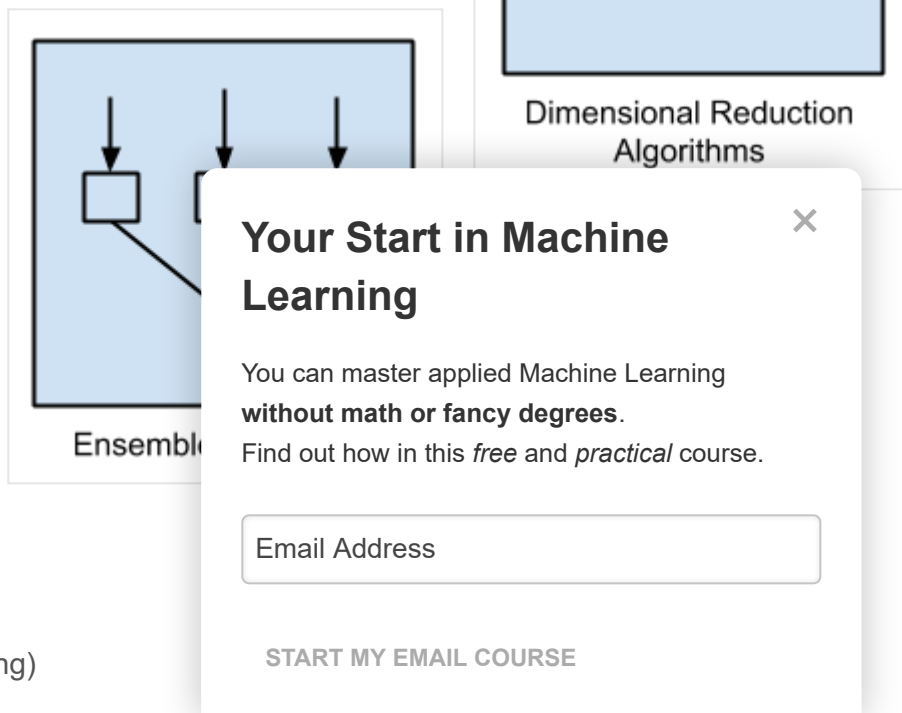

Many algorithms were not covered.

I did not cover algorithms from specialty tasks in the process of machine learning, such as:

- Feature selection algorithms
- Algorithm accuracy evaluation
- Performance measures
- Optimization algorithms

I also did not cover algorithms from specialty subfields of machine learning, such as:

- Computational intelligence (evolutionary algorithms, etc.)
- Computer Vision (CV)

- Natural Language Processing (NLP)
- Recommender Systems
- Reinforcement Learning
- Graphical Models
- And more...

These may feature in future posts.

## Further Reading on Machine Learning Algorithms

This tour of machine learning algorithms was intended to give you an overview of what is out there and some ideas on how to relate algorithms to each other.

I've collected together some resources for you to continue your journey. If you have a specific question, please leave a comment.

### Other Lists of Machine Learning Algorithms

There are other great lists of algorithms out there if you want more examples.

- [List of Machine Learning Algorithms](#): On Wikipedia. A good organization of the algorithms particularly useful.
- [Machine Learning Algorithms Category](#): Also on Wikipedia. A list of algorithms from the list above. It organizes algorithms alphabetically.
- [CRAN Task View: Machine Learning & Statistical Learning](#): A list of all the packages and all the algorithms supported by each machine learning package in R. Gives you a grounded feeling of what's out there and what people are using for analysis day-to-day.
- [Top 10 Algorithms in Data Mining: Published article](#) and now a [book](#) (Affiliate Link) on the most popular algorithms for data mining. Another grounded and less overwhelming take on methods that you could go off and learn deeply.

## How to Study Machine Learning Algorithms

Algorithms are a big part of machine learning. It's a topic I am passionate about and write about a lot on this blog. Below are few hand selected posts that might interest you for further reading.

- [How to Learn Any Machine Learning Algorithm](#): A systematic approach that you can use to study and understand any machine learning algorithm using "algorithm description templates" (I used this approach to write [my first book](#)).
- [How to Create Targeted Lists of Machine Learning Algorithms](#): How you can create your own systematic lists of machine learning algorithms to jump start work on your next machine learning problem.
- [How to Research a Machine Learning Algorithm](#): A systematic approach that you can use to research machine learning algorithms (works great in collaboration with the template approach listed above).

Your Start in Machine Learning

- [How to Investigate Machine Learning Algorithm Behavior](#): A methodology you can use to understand how machine learning algorithms work by creating and executing very small studies into their behavior. Research is not just for academics!
- [How to Implement a Machine Learning Algorithm](#): A process and tips and tricks for implementing machine learning algorithms from scratch.

## How to Run Machine Learning Algorithms

Sometimes you just want to dive into code. Below are some links you can use to run machine learning algorithms, code them up using standard libraries or implement them from scratch.

- [How To Get Started With Machine Learning Algorithms in R](#): Links to a large number of code examples on this site demonstrating machine learning algorithms.
- [Machine Learning Algorithm Recipes in scikit-learn](#): Demonstrating how to create predictive models using scikit-learn.
- [How to Run Your First Classifier in Weka](#): A tutorial on how to run a classifier in Weka (**code required!**).

## Final Word

I hope you have found this tour useful.

Please, leave a comment if you have any questions or feedback.

Hello Jason, hope u r fine!

How can we make a recommender system with the help of Neural network

&

how to implement Collaborative filtering with Neural network

**sam** February 17, 2017 at 6:09 pm #

REPLY ↩

What is the difference between a classifier and algorithm? Both r same?

**Jason Brownlee** February 18, 2017 at 8:36 am #

REPLY ↩

Hi Sam,

Your Start in Machine Learning

An algorithm is a procedure. Like learning a tree from data. The outcome of an algorithm is a model or a classifier, like the tree used to make predictions.

**Beat Tödtli** August 3, 2017 at 10:14 pm #

Then I don't quite understand the listing of both Back-Propagation and Hopfield Network under the title of "Artificial Neural Network Algorithms". Back-Propagation is clearly a training algorithm, whereas a Hopfield Network is probably a classifier?

Nice post!

**Jason Brownlee** August 4, 2017 at 10:14 pm #

That is fair. Rather than back

**Sameer** July 28, 2017 at 6:21 am #

Yes Please

Release a ebook on reinforcement learning and awesome Jason. You made things very simple

Not a single one for recommender systems?

**jasonb** May 23, 2014 at 8:02 am #

REPLY ↩

I would call recommender a higher-order system that internally is solving regression or classification problems. Do you agree?

**Jon** May 23, 2014 at 2:47 am #

REPLY ↩

genetic algorithms seem to be dying a slow death these days (discussed previously

<https://news.ycombinator.com/item?id=7712824> )

Your Start in Machine Learning

**jasonb** May 23, 2014 at 8:01 am #

REPLY ↩

It's a good point. Computers are fast enough that you can enumerate the search space faster than a GA can converge (at least with the classical toy problems).

**Alex** May 23, 2014 at 8:47 am #

REPLY ↩

I enjoyed this post but I think that this is a misinformed statement. Genetic Algorithms are most useful in large search spaces (enumerating spaces that could be  $10^{100}$ ) and highly complex problems much more sophisticated than the simple techniques (http://en.wikipedia.org/wiki/CMA-ES) and (http://en.wikipedia.org/wiki/Estimation\_of\_distribution\_application: http://www.cc.gatech.edu/~jtan34/)

REPLY ↩

Thanks @Tim, I'll add a section on time series algorithms I think.

**Vincent** June 9, 2014 at 7:50 pm #

REPLY ↩

Hi,

Thank's for this tour, it is very useful ! But I disagree with you for the LDA method, which is in the Kernel Methods. First of all, by LDA, do you mean Linear Discriminant Analysis ? Because if it's not, the next parts of my comment are useless :p

If you are talking about this method, then you should put KLDA (which stand for Kernel LDA) and not simply LDA. Because LDA is more a dimension reduction method than a kernel method (It finds the best hyperplane that optimize the Fisher discriminant in order to project data on it).

Next, I don't know if we can view the RBF as a real machine learning method. it's more a mapping function I think, but it is clearly used for mapping to a higher dimension.

Your Start in Machine Learning

Except these two points, the post is awesome ! Thank's again.

**Jason Brownlee** August 22, 2015 at 4:45 pm #

REPLY ↩

Thanks @Vincent, I'll look into moving the algorithms around a bit in their groupings.

**Rizwan Mian, PhD** September 2, 2017 at 7:03 am #

REPLY ↩

@Vincent, I think he mentions Radial Based Network or RBN which is artificial neural network (ANN) that uses radial basis functions [1]. Jason is

[1] [https://en.wikipedia.org/wiki/Radial\\_basis\\_function](https://en.wikipedia.org/wiki/Radial_basis_function)

**Rémi** June 10, 2014 at 8:50 pm #

Great post, but I agree with Vincent. Kernel M... themselves, but more an extension that allows to overco... are not linearly separable. SVM and LDA are not Kernel... use of the famous kernel-trick, giving birth to KSVM and... higher-dimensional space. Kernel trick can be applied

- LDA
- SVM
- PCA
- KMeans

and the list goes on...

Moreover, I don't think that RBF can be considered a machine learning method. It is a kernel function used alongside the kernel trick to project the data in a high-dimensional space. So the listing in "Kernel methods" seems to have a typing error :p

Last point, don't you think LDA could be added to the "Dimensionality Reduction" category ? In fact, it's more an open question but, mixture methods (clustering) and factor analysis could be considered "Dimensionality Reduction methods" since data can be labeled either by it's cluster id, or its factors.

Thanks again for this post, giving an overview of machine learning methods is a great thing.

I had this confusion and had to look it up.

- Radial Based Function (RBF) can be used as a kernel
- Radial Based Network (RBN) is a artificial neural network that uses radial basis functions

**Pranav Waila** June 10, 2014 at 9:24 pm #

REPLY ↩

Hi qnaguru, I have collected some nice reference books to start digging Machine learning. I would suggest you to start with “Introduction to statistical learning” and “The Elements of Statistical Learning: Data Mining, Inference, and Prediction” by David Barber”.

**Dean Abbott** July 3, 2014 at 9:48 am #

Very nice taxonomy of methods. Two small questions:  
1) MARS isn't a tree method, it's a spline method. You should even go in the regularization group. (not a natural fit in the tree group)  
2) Random Forests is an ensemble method and sticks to the MART (TreeNet) and some flavors of Adaboost. If already there, I think you can safely remove it from the list.

Again, you've done a great job with this list. Congrats!

Dean

Great list. Definitely cleared things up for me, Jason! I do have a question concerning Batch Gradient Descent and the Normal Equation. Are these considered Estimators?

I would love to see a post that addresses the different types of estimators / optimizers that could be used for each of these algorithms that is simple to understand. Also where does feature scaling (min max scaling & standardization) and other things fall into all of this? Are they also optimizers? So many things!

Thanks so much for spreading your knowledge!

Hi Jason

Intrigued by your comments above about recommendation systems ie.

"I would call recommender a higher-order system that internally is solving regression or classification problems." and,

"You can break a recommender down into a classification or a regression problem."

Your Start in Machine Learning

Could you please expand on your thought process? In general, I find that people talk about building or wanting a “classifier” since it is the de-jure buzzword (and related to deep learning) when in fact, a recommender or something else will do the job. Anyway, great discussion.

Hi jason,

Can you recommend any algorithm to my problem below please?  
I need one that does time series analysis that does Bayesian analysis too.

For test set,

I'm given data for hourly price movements for half a day, and tasked to predict for the second half of day.  
Clearly a time series (TS) problems.

But on top of that I'm also given information on 10 discrete factors for each day in the training and testing set.

Do you know of any algo that creates multiple TS models conditional upon the values (or bands) of the various discrete factors at the onset?

Hi Jason

I would be very grateful if you could let me know which neural network is useful for multivariate time series classification. For example, classifying patient and health feature.

**Fredrik** February 22, 2016 at 11:55 pm #

Did you find any solution for this? I have tried neural networks and use the feature space to create an example, each row in the pixel image will be a RGB value at a specific time point. That way you have all multivariate data reduce the dimensionality of the time interval though the time interval in sections of the image (first 500 pixels for example). I have no idea if this would work, just some thoughts...

I have a good background in artificial intelligence and machine learning, and I must say this is a really good list, I would not have done the categories any other way, it's very close to perfection. Very pertinent information.

However, it would be nice to include Learning Style categories for reinforcement learning, genetic algorithms and probabilistic models, (but meanwhile you already mention them at the end so this gives a good pointer for the readers).

The ending links are very good, particularly the "How to Study Machine Learning Algorithms". It would be also nice to put a list of machine learning online courses (coursera, udacity, etc. – there's even a course by Geoffrey Hinton!), and links to tutorials on how to check and verify that your ML algo works well on your dataset (cross-validation, generalization curve, ROC, confusion matrix, etc.).

Also, thank's to previous commenters, your comments are also very pertinent and a good addition to the article!

**Your Start in Machine Learning**

**Irq3000** January 28, 2016 at 8:25 pm #

REPLY ↩

To develop my suggestion for adding Learning Style categories: I think these classes of learning algorithms should be added, since they are used more and more (albeit being less popular than the currently listed methods) and they cannot be replaced by other classes of learning, they bring their own capabilities:

– Reinforcement learning models a reward/punishment way of learning. This allows to explore and memorize the states of an environment or the actions with a way very similar on how the actual brain learns using the pleasure circuit (TD-Learning). It also has a very useful ability: blocking, which naturally allows a reinforcement learning model to only use the stimuli and information that is useful to predict the reward, the useless stimuli will be “blocked” (ie, filtered out). This is currently being used in combination with deep learning to model more biologically plausible and powerful neural networks, that can for example maybe solve the Go game problem (see Google’s DeepMind /

– Genetic algorithms, as a previous commenter said, a problem or multimodal optimizations (where you have equilibriums). Also, a big advantage is that genetic algorithms are VERY generic and can be applied to virtually any problem (genetic algorithms may find better ones).

– Probabilistic models (eg, monte-carlo, markov chains, probabilistic graphical models (eg, bayesian networks, uncertain situations and for inference, since they can model uncertainty). Graphical models are kinda close to deep learning, but from a semantic of what you want to do than a deep learning model.

– Maybe mention at the end Fuzzy Logic, which is not probabilistic models, except that it can be seen as a superset that also allows to define a possibility value (see possibilistic logic, and the works by Edwin Jaynes).

I'm glad you found it useful Howard.

Your Start in Machine Learning

**srinivas n** September 15, 2016 at 7:28 am #

REPLY ↩

This is useful, but it could be made more useful for someone new to the field, specifically in the section where algorithms are grouped by similarity, by clarifying exactly what is being learned. Eg Regression algorithms learn the curve that best fits the data points, Bayesian learning algorithms learn the parameters and structure of a Bayesian network, Decision Tree algorithms learn the structure of the decision tree, etc.

Additionally some kind of task based classification would be helpful. Eg if you're trying to classify then the following kinds of ML algorithms are best, if you're trying to do inference then rule learning and bayesian network learning are good, if you're curve fitting then regression is good, etc.

**srinivas n** September 15, 2016 at 7:31 am #

Just to clarify that first point I made: eg when method itself that's being learned, nor whether a given parameters of that network that apply Bayes method a

Jason, this is an excellent list, thank you.

I am totally new to the topic – so it is a good starting point. In other 'domains' of methods, patterns or algorithm types I am more familiar with one could typically define generic weaknesses/pains, strengths/gains and things to look at with care (e.g. how to set parameters). I wonder what those would be for each of the algorithm groups you specified.

I have seen that you described use cases, e.g. one could use Bayesian Algorithms and Decision Tree Algorithms for classification. But when would I e.g. prefer the one over the other for classification? ...just an example...

**Jason Brownlee** November 19, 2016 at 8:49 am #

REPLY ↩

It's a great question Steffen, and very hard to answer.

The best practical approach to find the best/good algorithms for a given problem is trial and error. Heuristics provide a good guide, but sometimes/often you can get best results by breaking some rules or modeling assumptions.

I recommend empirical trial and error (or a bake-off of methods) on a given problem as the best approach.

Thanks Iman.

**sbollav** December 15, 2016 at 9:57 pm #

Hi Jason,

Thank you for kind reply.

Master Machine Learning Algorithms – With this book, is it possible to understand how the algorithm works and how to build the predictive models for different kinds training sets.

And by seeing the problem or train data, can we say that the machine learning (tree based, knn, Naive base or optimisation ) and the algorithms (cart, c4.5) are best suitable.

I can purchase that above book that you have mentioned –

But I am more concerned with how the algorithm works (more illustration) and apply in machine learning. Present i am using R.

Thanks Kumar, sorry I don't have material on clustering.

**Girish Korekar** June 14, 2017 at 2:55 am #

REPLY ↩

I would like know about the How an 'algorithms' works on "Machines"?

Here, please consider "Machines" as a "Humans" or "biological VIRUS" or "any living cells".

I would say biological individuals have a logical series of an algorithm, which is regulates their commands and response. These algorithms we may call as a 'Genetic Material' as 'DNA or RNA'; but I would like to see them as an "ALGORITHMMS" which is regulates there all activities like responses and commands. Because, particular DNA or RNA sequences have special type of code, which can be used by different performers, here performers are Enzymes.

My query is that, can we able to form algorithms like DNA or RNA which can be able to run a Machine? It can be possible to form a Human made Biological VIRUS that can be cure our infected cells within a Human Body?

Your Start in Machine Learning

**Jason Brownlee** June 14, 2017 at 8:49 am #

REPLY ↩

Sure, take a look at biologically inspired computational methods.

I have a whole book on the topic:

Hello Jason, could you label all the algorithms supervised? It's easy enough to understand what these are.  
Thanks.

**Jason Brownlee** July 31, 2017 at 8:19 am #

REPLY ↩

Most of applied machine learning (e.g. predictive modeling) is concerned with supervised learning algorithms.

The majority of algorithms listed on this page are supervised.

**David Nettleton** August 1, 2017 at 2:33 am #

REPLY ↩

Hi Jason, thanks for your great article! I would propose an alternative classification of ml algorithms into two groups: (i) those which always produce the same model when trained from the same dataset with the records presented in the same order and (ii) those which produce a different model each time. But I would be interested on your thoughts about this.  
Best regards, David

**Jason Brownlee** August 1, 2017 at 8:03 am #

REPLY ↩

Your Start in Machine Learning

Nice David. Really this is the axis of “model variance”.

Think of it as a continuum though, not binary. Many (most!) ML algorithms suffer variance of some degree.

**David Nettleton** August 4, 2017 at 7:25 pm #

REPLY ↩

Thanks for your reply, Jason. Yes, the continuous scale would be better. Some years ago I worked with simulated annealing/gradient descent, genetic algs. and neural networks (which performed random jumps to escape local minimums). However, on the other hand, the information gain calculation inside a rule induction algorithm such as M5Rules always for article ;-

**Jason Brownlee** August 5, 2017 at 10:11 am #

Thanks for the suggestion David.

**Mirna Magdy** August 9, 2017 at 3:14 am #

Great job , but you didn't include References for your topic!!!

Hi Jason

I have created several supervised models with some results. I am interested in how to create a data driven application using these models.

**Jason Brownlee** August 30, 2017 at 6:16 am #

REPLY ↩

You would need to treat it like any other software project and start by defining the goals/requirements of the project.

**Rizwan Mian, PhD** September 2, 2017 at 7:13 am #

REPLY ↩

Thanks Jason. Another superb job. 😊

For sometime now, I have been looking for an authoritative paper on taxonomy, survey and classification of ML algorithms with examples. This article is absolutely a step in that direction — can be massaged into a taxonomy/survey paper?

Nonetheless as other readers noticed, it is missing some topics: preprocessing including anomaly detection and feature selection, NLP, genetic algorithms, recommender systems etc.

Wonder if you know of any academic work on the topic. I did not find any in ACM CSUR.

Waiting anxiously! 😊

**Cheng** January 5, 2019 at 7:21 am #

REPLY ↩

Hi Jason,

Thanks for the post, how could you categorize ReLU, GANs and RBM in this mindmap? If you put activation functions such as logistic regression and linear regression under the Regression section, should ReLU be there as well? And likewise, should GANs and RBM under Deep Learning?

**Jason Brownlee** January 6, 2019 at 10:12 am #

Your Start in Machine Learning

Relu is an activation function, a part of a neural net, not an algorithm per se.

GAN is an unsupervised neural network algorithm.

RBM is a supervised neural net algorithm and also redundant, replaced by MLPs with Relu.

Logistic regression and linear regression are not activation functions, they are algorithms, solved via least squares.

**Anitha Florence** January 29, 2019 at 5:07 pm #

REPLY ↩

Its good to learn machine learning. Can the non- computer Science people learn this. Please tell way to learn.

**Jason Brownlee** January 30, 2019 at 8:05 am #
